Tucker Miller

Indianapolis, IN | Open to hybrid & on-site | 260.706.1288 | tuckerdanielmiller@gmail.com | TuckerMiller.dev | github.com/tdmiller1 | linkedin.com/in/tuckermiller7

Senior software engineer, seven years at enterprise scale. Bootstrapped and owns the micro-frontend platform a flagship product surface runs on, mentors the engineers building on it, and designs asynchronous, event-driven data pipelines, microservices, and cloud infrastructure end to end.

EXPERIENCE

Seismic (formerly Lessonly) · Indianapolis, IN — March 2020 – Present

Senior Software Engineer II — 2025 – Present

Senior Software Engineer — 2022 – 2025

Software Engineer — 2020 – 2022

- Bootstrapped `web-skills-assets`, the micro-frontend platform that now underpins the entire Skills 2.0 surface — import-map build system, Webpack config, Jenkins CI/CD, and branch-deploy infrastructure. **700+** PRs from the wider team have since landed on it.
- Migrated Skills onto Seismic's Next Gen micro-frontend architecture, unblocking shared runtime upgrades and independent deploys; moved its builds from CommonJS to ESM, unblocking import-map compatibility platform-wide.
- Mentored **5** engineers onto the platform and its build system — 2 formally, 3 informally — and handed off ownership of multiple components to them.
- Stood up `web-scorecards-assets`, a shared UI component library consumed by **3** internal teams across **6** interfacing features, driving **10K+** AI scorecards for **100** customers in 6 months.
- Owned Assessment-level Reporting end to end, then refactored its service layer across **74** files to lift data access out of components; moved Skills backend endpoints onto a Repository → Service → Router layering.
- Built the queued background job service behind Skills' LLM-backed features — prompt construction and output-structure orchestration against internal LLM APIs, with polling for state and results.
- Took the individual rep view from internal beta to GA with backing REST data endpoints and scoped service-to-service tokens, clearing the high-priority QA blockers ahead of launch.
- Shipped advanced search returning results in under 25 ms.

Ontario Systems · Muncie, IN — May 2019 – February 2020

Software Engineer I

- Increased automated test coverage by 300% by reworking the Cucumber test design, and led the team through a migration to a new source control management platform.
- First intern of 30 offered a full-time position, two months ahead of schedule.

SELECTED PROJECT

OpenSermon · Personal project — February 2026 – Present

An open, searchable archive of sermons: a distributed crawler that discovers and transcribes sermon media, feeding a React + FastAPI web app.

48,901 sermons · **634** churches · **~50M** transcript segments · **915** commits, **58** releases, **749** tests in 6 months

- Architected an asynchronous, event-driven six-stage ingest pipeline — discover, extract, resolve, acquire, transcribe, push — where independent microservice workers pull jobs from SQS queues and never touch credentials or the database directly, so any stage can fail without stalling the rest; the distributed crawler coordinates through a FastAPI control plane.
- Cut transcription cost from roughly **$0.58–$1.20 per sermon** on managed transcription services to **$0.0045–$0.009** self-hosted, by moving inference to an on-prem GPU pool and paying only S3 egress.
- Shipped the segment-grain full-text search foundation — a flattened segment table with a `GENERATED STORED tsvector` and GIN index — replacing a cross-corpus query that unnested 46M JSON elements at read time and timed out past 60 s. Deployed on AWS as eleven composed CloudFormation stacks (ECS Fargate, SQS + DLQs, RDS, Cognito, CloudFront + S3).

SKILLS

Languages	JavaScript, TypeScript, Ruby, Python, SQL, HTML, CSS
Architecture	Distributed systems, microservices, event-driven & asynchronous systems, message queues (SQS + DLQs), micro-frontends & import maps, design systems, REST & GraphQL APIs
Front end	React, Next.js, Apollo / GraphQL, Vite, Tailwind, Cypress, accessibility
Back end & infra	Node.js, Ruby on Rails, FastAPI, PostgreSQL (full-text search, GIN indexing), MongoDB; AWS (CloudFormation / infrastructure as code, ECS Fargate, Lambda, Cognito identity, CloudFront), Docker, Jenkins CI/CD, Agile, AI-assisted development (multi-agent pipelines, Claude Code)

EDUCATION

Ball State University — B.S. Computer Science (completed in three years) — May 2019
