

Tucker Miller

Indianapolis, IN | Open to hybrid & on-site | 260.706.1288 | tuckerdanielmiller@gmail.com | TuckerMiller.dev | github.com/tdmiller1 | linkedin.com/in/tuckermiller7

Senior software engineer, seven years at enterprise scale. Bootstrapped and owns the micro-frontend platform a flagship product surface runs on, mentors the engineers building on it, and designs asynchronous, event-driven data pipelines, microservices, and cloud infrastructure end to end.

EXPERIENCE

Seismic (formerly Lessonly) · Indianapolis, IN	March 2020 – Present
Senior Software Engineer II	2025 – Present
<i>Senior Software Engineer</i>	2022 – 2025
<i>Software Engineer</i>	2020 – 2022

- Bootstrapped **web-skills-assets**, the micro-frontend platform that now underpins the entire Skills 2.0 surface: import-map build system, Webpack config, Jenkins CI/CD, and branch-deploy infrastructure. **700+** PRs from the wider team have since landed on it.
- Migrated Skills onto Seismic's Next Gen micro-frontend architecture, unblocking shared runtime upgrades and independent deploys; moved its builds from CommonJS to ESM, unblocking import-map compatibility platform-wide.
- Mentored **5** engineers onto the platform and its build system (2 formally, 3 informally), and handed off ownership of multiple components to them.
- Stood up **web-scorecards-assets**, a shared UI component library consumed by **3** internal teams across **6** interfacing features, driving **10K+** AI scorecards for **100** customers in 6 months.
- Introduced a Repository → Service → Route layering and won support for it across both the Assessment Service and the Skills microservices. Shipped advanced search returning results in under 25 ms.
- Built the queued background job service behind Skills' LLM-backed features: prompt construction and output-structure orchestration against internal LLM APIs, with polling for state and results.
- Took the individual rep view from beta to GA with backing REST data endpoints and scoped service-to-service tokens.
- Shipped production Ruby on Rails through the first **18 months** at Seismic; Postgres continuously on every instance since.

Ontario Systems · Muncie, IN	May 2019 – February 2020
<i>Software Engineer I</i>	

- Increased automated test coverage by 300% by reworking the Cucumber test design, and led the team through a migration to a new source control management platform.

SELECTED PROJECT

OpenSermon · Personal project	February 2026 – Present
--------------------------------------	-------------------------

A production web service for searching and preserving sermons, fed by a fully automated ingest pipeline. Presented the project by invitation at the Association for the Sociology of Religion's 87th Annual Meeting.

49,779 sermons · 634 churches · 50M transcript segment rows · 85 registered users from 322 unique visitors · 2,071 tests	
• Own the production service: a FastAPI REST API across 22 route modules behind React, with Cognito identity, Stripe sponsorships, subscriptions and credit packs, and admin consoles. • Architected the asynchronous, event-driven six-stage ingest pipeline, which runs unattended: a twice-weekly cron fans out one incremental crawl per church from a registry of known sermon pages, de-duplicating on normalized URLs so only new media reaches the queues. On-prem GPU inference cut transcription cost from roughly \$0.58–\$1.20 per sermon to \$0.0045–\$0.009. • Shipped segment-grain full-text search, a flattened segment table with a GENERATED STORED tsvector and GIN index, replacing a cross-corpus query that unnested every segment as JSON and timed out past 60 s. Runs on ten composed CloudFormation stacks (ECS Fargate, SQS + DLQs, RDS, Cognito, CloudFront). • Built the multi-agent workflow the project runs on: stories pass research, plan, implement and validate gates, each leaving a written artifact. 33 features shipped through it.	

SKILLS

Languages	JavaScript, TypeScript, Ruby, Python, SQL, HTML, CSS
Architecture	Distributed systems, microservices, event-driven & asynchronous systems, message queues (SQS + DLQs), micro-frontends & import maps, design systems, REST & GraphQL APIs
Front end	React, Next.js, Apollo / GraphQL, Vite, Tailwind, Cypress, accessibility
Back end & infra	Node.js, Ruby on Rails, FastAPI, PostgreSQL (full-text search, GIN indexing), MongoDB; AWS (CloudFormation / infrastructure as code, ECS Fargate, Lambda, Cognito identity, CloudFront), Docker, Jenkins CI/CD, Agile, AI-assisted development (multi-agent pipelines, Claude Code)

EDUCATION

Ball State University , B.S. Computer Science (completed in three years)	May 2019
